Pracownia Problemowa, 2015

Outline

1 OWA-Winner to SAT-CNF

2 Results

OWA-Winner problem - one more time

- Notation used in this presentation:
 - α_k - OWA vector
 - u_{i,a_j} - Utility function value that i -th voter assigns to j -th item/candidate
 - $x_{i,j,k}$ - 1 if i -th voter places j -th item/candidate on k -th position in own preference list
- The goal of the OWA-Winner problem is to determine comitee (set of items/candidates) of cardinality K maximizing the following expression:

$$\sum_{i=1}^n \sum_{j=1}^m \sum_{k=1}^K \alpha_k u_{i,a_j} x_{i,j,k}$$

ILP Formulation

Theorem 11. OWA-WINNER reduces to computing a solution for the following integer linear program.

$$\text{minimize } \sum_{i=1}^n \sum_{j=1}^m \sum_{k=1}^K \alpha_k u_{i,a_j} x_{i,j,k}$$

subject to:

$$(a) : \sum_{i=1}^m x_i = K$$

$$(b) : x_{i,j,k} \leq x_j, \quad , i \in [n]; j, k \in [K]$$

$$(c) : \sum_{j=1}^m x_{i,j,k} = 1, \quad , i \in [n]; k \in [K]$$

$$(d) : \sum_{k=1}^K x_{i,j,k} = 1, \quad , i \in [n]; j \in [m]$$

$$(e) : \sum_{j=1}^m u_{i,a_j} x_{i,j,k} \geq \sum_{j=1}^m u_{i,a_j} x_{i,j,(k+1)}, \quad , i \in [n]; k \in [K-1]$$

$$(f) : x_{i,j,k} \in \{0, 1\}, \quad , i \in [n]; j, k \in [K]$$

$$(g) : x_j \in \{0, 1\}, \quad , j \in [m]$$

SAT Formulation

```
model = OWAModel(length=8)
y = [model.add_var('y' + str(j)) for j in xrange(m)]
x = [[[model.add_var('x' + str(i) + '|' + str(j) + '|' + str(k)) for k in xrange(K)] for j in xrange(m)] for i in xrange(n)]

# (a) Exactly K candidates are chosen
sum([1*yy for yy in y]) == K

# (b) x and y are consistent with each other
for i in xrange(n):
    for j in xrange(m):
        for k in xrange(K):
            model.add_clause([~x[i][j][k], y[j]])

# (c) Only 1 candidate is ranked as k-th best
for i in xrange(n):
    for k in xrange(K):
        model.exactly_one_of([x[i][j][k] for j in xrange(m)])

# (d) Candidate 'j' is ranked precisely on one position for 'i'
for i in xrange(n):
    for j in xrange(m):
        model.at_most_one_of([x[i][j][k] for k in xrange(K)])

# (e) Candidate placed on k-th position is at least as valuable (for particular voter) as one placed on k+1-th position
for i in xrange(n):
    for k in xrange(K-1):
        sum([u[i][j]*x[i][j][k] for j in xrange(m)]) >= sum([u[i][j]*x[i][j][k+1] for j in xrange(m)])

# (objective)
solution, max_val = model.maximize(sum([(alpha[k]*u[i][j])*x[i][j][k] for i in xrange(n) for j in xrange(m) for k in xrange(K)]), lb=0)
```

SAT Formulation - binary utility and OWA vector

Both utility function and OWA vector are binary. In addition to this OWA vector is nonincreasing.

```
model = BinaryOWAModel(length=1)
y = [model.add_var('y' + str(j)) for j in xrange(m)]
x = [[[model.add_var('x' + str(i) + '|' + str(j) + '|' + str(k)) for k in xrange(K)] for j in xrange(m)] for i in xrange(n)]

# (a) Exactly K candidates are chosen
model.exactly_k_of(y, K)

# (b)
for i in xrange(n):
    for j in xrange(m):
        for k in xrange(K):
            model.add_clause([-x[i][j][k], y[j]])

# (c) Only 1 candidate is ranked as k-th best
for i in xrange(n):
    for k in xrange(K):
        model.exactly_k_of([x[i][j][k] for j in xrange(m)], 1)

# (d) Item 'j' is ranked precisely on one position for 'i'
for i in xrange(n):
    for j in xrange(m):
        model.at_most_k_of([x[i][j][k] for k in xrange(K)], 1)

l = [x[i][j][k] for i in xrange(n) for j in xrange(m) for k in xrange(K) if alpha[k]*u[i][j] > 0]

model.at_least_k_of(l, int(sys.argv[1]))
```

Boolean cardinality constraints

- Given a set of boolean variables $\{x_1, x_2, \dots, x_n\}$ we want to ensure that exactly (at least, at most,...) $k \leq n$ of them are set to True
- At least one of the variables is set to True ?
- Easy: $x_1 \vee x_2 \vee \dots \vee x_n$
- At most one of the variables is set to True ?
- Idea: Ensure that for every pair of variables at least one of the variables is False !
- How to model generic 'at least k of' and 'at most k ' of constraints ?

Encoding at most k of constraint

Below is the encoding that requires additional $k * n$ variables: s to ensure that at most k of n variables from x sequence are chosen:

$$\left. \begin{array}{l} (\neg x_1 \vee s_{1,1}) \\ (\neg s_{1,j}) \quad \text{for } 1 < j \leq k \\ (\neg x_i \vee s_{i,1}) \\ (\neg s_{i-1,1} \vee s_{i,1}) \\ (\neg x_i \vee \neg s_{i-1,j-1} \vee s_{i,j}) \\ (\neg s_{i-1,j} \vee s_{i,j}) \\ (\neg x_i \vee \neg s_{i-1,k}) \\ (\neg x_n \vee \neg s_{n-1,k}) \end{array} \right\} \text{ for } 1 < j \leq k \left. \vphantom{\begin{array}{l} (\neg x_1 \vee s_{1,1}) \\ (\neg s_{1,j}) \\ (\neg x_i \vee s_{i,1}) \\ (\neg s_{i-1,1} \vee s_{i,1}) \\ (\neg x_i \vee \neg s_{i-1,j-1} \vee s_{i,j}) \\ (\neg s_{i-1,j} \vee s_{i,j}) \\ (\neg x_i \vee \neg s_{i-1,k}) \\ (\neg x_n \vee \neg s_{n-1,k}) \end{array}} \right\} \text{ for } 1 < i < n$$

[1] Source: Towards an Optimal CNF Encoding of Boolean Cardinality Constraints

Implementation of at most k of constraint

Below is my implementation of at most k of encoding proposed by Sinz:

```
def at_most_k_of(self, x, k):  
    n = len(x)  
    if n <= 1:  
        return  
  
    s = [[self.add_var() for j in xrange(k)] for i in xrange(n-1)]  
    self.add_clause([~x[0], s[0][0]])  
    for j in xrange(1, k):  
        self.add_clause([~s[0][j]])  
    for i in xrange(1, n-1):  
        self.add_clause([~x[i], s[i][0]])  
        self.add_clause([~s[i-1][0], s[i][0]])  
        for j in xrange(1, k):  
            self.add_clause([~x[i], ~s[i-1][j-1], s[i][j]])  
            self.add_clause([~s[i-1][j], s[i][j]])  
            self.add_clause([~x[i], ~s[i-1][k-1]])  
        self.add_clause([~x[n-1], ~s[n-2][k-1]])  
    return s
```

General results

- Tests were conducted by applying PycoSAT solver to general and binary OWA models
- Bigger OWA-winner problem instances can be solved by using binary OWA model (because binary OWA model is more efficient, but at the same time more restricting)
- As K gets bigger and bigger the produced boolean formulas are becoming larger and larger very rapidly

Example: general OWA-winner instance

The optimization run below lasted for about 10 minutes.

p cnf 26199 124996

Produced boolean formula is available at: owa3.dimacs

```
n=6, m=12, K=5
alpha=3 3 3 2 1
u=
3 4 2 1 0 1 2 0 3 5 0 4
4 2 1 3 0 2 3 0 1 3 1 5
1 2 3 0 4 5 2 3 1 1 2 0
0 1 3 4 1 5 1 0 2 1 3 1
1 0 1 3 5 1 2 1 5 3 1 0
2 3 4 2 3 3 1 4 2 2 4 1

w=[1, 0, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0]
```

Example: binary OWA-winner instance

To solve this one below to optimality I took roughly 90 minutes on my machine...

```
n=50, m=20, K=10  
alpha=1 1 1 1 1 1 1 0 0 0  
u=  
0 0 1 0 1 1 1 1 0 0 0 0 0 0 0 0 1 0 0 0 0  
1 0 0 0 0 1 0 0 0 0 1 0 1 1 0 0 0 1 1 0  
0 1 0 0 0 1 0 1 0 0 1 0 0 0 0 0 1 1 0 0  
0 0 0 0 1 0 1 0 0 0 1 0 0 1 1 0 1 0 0 0  
0 0 0 0 0 0 0 0 0 0 0 0 1 0 0 1 0 1 1 0  
0 1 0 1 0 0 0 1 0 0 0 0 1 0 0 0 0 0 0 0  
0 1 0 1 0 0 1 1 0 0 0 0 0 0 1 1 1 0 0 1  
1 0 1 1 0 0 1 0 0 0 0 1 1 0 1 0 1 0 1 0  
1 0 0 0 1 1 0 0 1 0 1 0 0 0 0 0 0 0 1 0  
0 1 0 0 1 0 1 0 1 0 0 0 0 0 0 1 0 1 0 1  
0 0 1 0 1 0 0 1 1 0 0 0 0 1 0 1 1 0 1 1  
1 1 0 0 0 1 0 0 0 1 1 0 0 0 1 0 0 0 0 0  
0 0 0 0 0 1 0 0 1 1 0 0 0 0 1 0 0 0 0 0  
1 1 0 0 1 1 0 0 1 0 0 0 1 0 0 0 1 0 0 0  
0 0 1 0 1 0 0 0 0 1 1 1 1 0 0 1 0 1 1 0  
0 0 1 1 1 1 0 0 0 0 0 1 0 1 1 1 0 0 0 0  
0 0 0 0 1 0 1 1 0 0 0 1 0 0 1 0 1 0 0 0  
0 0 0 0 0 1 1 0 1 0 1 1 0 0 1 0 0 0 0 0
```

Summary

- Reduction from OWA-Winner to SAT-CNF was presented with some (but not all) quirks
- In addition to general OWA-Winner I prepared more efficient reduction for OWA-Winner with binary utility and OWA-vector (+ nonincreasing OWA vector)
- One idea might to evaluate resolution procedure known from logic (to see how quickly size of the formula is exploding as resolution is being performed (e.g. using: Factorization and OWA-Winner instances))
- TODO: Evaluation of some algorithms (including classification heuristics) on generated SAT instances
