Modeling selected computational problems as SAT-CNF and analyzing (some) structural properties of obtained formulas

Michał Mrowczyk

Department of Computer Science AGH Kraków

M.Sc. Defense, 2017

Goals

- Reduce selected computational problems i.e. the Integer-Factorization and the OWA-Winner to SAT-CNF
- Investigate properties of the obtained formulas (using SAT solvers such as PicoSAT to solve these formulas)
 - running time of the solver
 - clauses to variables ratio
 - ...

SAT Decision Problem

- Given a boolean formula F decide (answer yes/no) whether there exists a satisfying assignment of True/False to variables (so that the formula evaluates to True).
- $x_1 \wedge (\overline{x_1} \vee x_2)$
- Setting $x_1 = 1$ and $x_2 = 1$ makes the formula above to evaluate to 1 (True), so we call it satisfiable (SAT)
- What about this one: $(\overline{x_1} \vee \overline{x_2}) \wedge (\overline{x_1} \vee x_2) \wedge (x_1 \vee \overline{x_2}) \wedge (x_1 \vee x_2)$?
- It turns out that this one always evaluates to 0 (False), so we call it unsatisfiable (UNSAT)

SAT Decision Problem

- Given a boolean formula F decide (answer yes/no) whether there exists a satisfying assignment of True/False to variables (so that the formula evaluates to True).
- $x_1 \wedge (\overline{x_1} \vee x_2)$
- Setting $x_1 = 1$ and $x_2 = 1$ makes the formula above to evaluate to 1 (True), so we call it satisfiable (SAT)
- What about this one: $(\overline{x_1} \lor \overline{x_2}) \land (\overline{x_1} \lor x_2) \land (x_1 \lor \overline{x_2}) \land (x_1 \lor x_2)$?
- It turns out that this one always evaluates to 0 (False), so we call it unsatisfiable (UNSAT)

Pseudo DIMACS Format

- A way of writing (format) boolean formulas
- Example:

$$(x_1 \vee \overline{x_2} \vee x_3) \wedge (x_2 \vee x_4) \wedge (\overline{x_3} \vee x_5) \rightarrow (1, -2, 3), (2, 4), (-3, 5)$$

$$1 -2 3$$

$$-3$$
 5

Big Picture

- We want to transform the instances of both OWA-Winner and Integer-Factorization problems into the boolean formulas
- ... And investigate properties of these formulas

```

OWA-Winner Problem Introductory Example

	$u(a_1)$	$u(a_2)$	$u(a_3)$	$u(a_4)$	$u(a_5)$	$u(a_6)$
3 agents	5	4	3	0	2	1
2 agents	4	0	2	3	1	5
1 agent	0	3	2	4	5	1

- We want to select K = 3 candiates
- What is the score of $\{a_1, a_2, a_6\}$ given the utility matrix below?
- $5 \ge 4 \ge 1$, $5 \ge 4 \ge 0$, $3 \ge 1 \ge 0$ orderings of utilities for agents on $\{a_1, a_2, a_6\}$
- We use the following OWA vector: $\alpha = (2,1,0)$

score =
$$3 \cdot (2 \cdot 5 + 1 \cdot 4 + 0 \cdot 1) + 2 \cdot (2 \cdot 5 + 1 \cdot 4 + 0 \cdot 0) + 1 \cdot (2 \cdot 3 + 1 \cdot 1 + 0 \cdot 0) = 42 + 28 + 7 = 77$$

OWA-Winner Problem

- The notation used in this presentation:
 - ullet $lpha_k$ is an OWA vector
 - u_{i,aj} is a utility function value that i-th voter assigns to the j-th item/candidate
 - $x_{i,j,k}$ is 1 if the *i*-th voter views the *j*-th item/candidate on the k-th position from items taken into the solution
- The goal of the OWA-Winner problem is to determine a comitee (set of items/candidates) of cardinality K maximizing the following expression:

•

$$\sum_{i=1}^{n} \sum_{j=1}^{m} \sum_{k=1}^{K} \alpha_{k} u_{i,a_{j}} x_{i,j,k}$$

 We convert the OWA-Winner problem instances to ILP and then to SAT-CNF

ILP Formulation of the OWA-Winner

[2] Source: Finding a Collective Set of Items: From Proportional Multirepresentation to Group Recommendation

$$\text{maximize } \sum_{i=1}^n \sum_{j=1}^m \sum_{k=1}^K \alpha_k \, u_{i,\mathbf{a}_j} \times_{i,j,k}$$

subject to:

$$(a): \sum_{i=1}^{m} y_i = K$$

$$(b): x_{i,i,k} \leq y_i$$

$$(c): \sum_{j=1}^{m} x_{i,j,k} = 1$$

$$(d): \sum_{k=1}^{K} x_{i,j,k} \leq 1$$

(e):
$$\sum_{i=1}^{m} u_{i,a_{j}} \times_{i,j,k} \ge \sum_{i=1}^{m} u_{i,a_{j}} \times_{i,j,(k+1)}$$

$$(f): x_{i,i,k} \in \{0,1\}$$

$$(g): y_i \in \{0,1\}$$

$$i \in [n]; j \in [m]; k \in [K]$$

$$i \in [n]; k \in [K]$$

$$i \in [n]; j \in [m]$$

$$i \in [n]; k \in [K-1]$$

$$,i\in [n];j\in [m];k\in [K]$$

$$j \in [m]$$

SAT Formulation of the OWA-Winner

$$(m): \mathit{CNF}(\sum_{i=1}^n \sum_{j=1}^m \sum_{k=1}^K \alpha_k u_{i,a_j} x_{i,j,k} \ge L) \qquad \qquad L \in \mathbb{N}$$

(a):
$$CNF(=K(\{y_j|j\in[m]\}))$$

$$(b):(\overline{x_{i,j,k}},y_j)$$

(c):
$$CNF(=1(\{x_{i,i,k}|j\in[m]\}))$$

$$(d): CNF(<_1(\{x_{i,j,k}|k\in [K]\}))$$

(e):
$$CNF(\sum_{j=1}^{m} u_{i,a_j} x_{i,j,k} \ge \sum_{j=1}^{m} u_{i,a_j} x_{i,j,(k+1)})$$

$$(f): x_{i,j,k} \in \{0,1\}$$

$$(g): y_i \in \{0,1\}$$

$$i \in [n]; j \in [m]; k \in [K]$$

$$i \in [n]; k \in [K]$$

$$,i\in[n];j\in[m]$$

$$i \in [n]; k \in [K-1]$$

$$,i\in[n];j\in[m];k\in[K]$$

$$,j\in[m]$$

SAT Formulation - Binary Utility and OWA Vector

Both the utility function and the OWA vector are binary. In addition to this the OWA vector is nonincreasing.

$$(m) : CNF(_{\geq L}(\{x_{i,j,k}|i\in[n],j\in[m],k\in[K],\alpha_ku_{i,a_j}>0\}))$$

$$(a) : CNF(_{=K}(\{y_j|j\in[m]\}))$$

$$(b) : (\overline{x_{i,j,k}},y_j)$$

$$(c) : CNF(_{=1}(\{x_{i,j,k}|j\in[m]\}))$$

$$(d) : CNF(_{\leq 1}(\{x_{i,j,k}|k\in[K]\}))$$

$$(f) : x_{i,j,k} \in \{0,1\}$$

$$(i) : x_{i,j,k} \in \{0,1\}$$

$$(i) : x_{i,j,k} \in \{0,1\}$$

$$(i) : x_{i,j,k} \in \{0,1\}$$

 $j \in [m]$

 $(g): y_i \in \{0,1\}$

General Results

- Tests were conducted by applying the PicoSAT solver to general and binary OWA-Winner models
- Bigger OWA-Winner problem instances can be solved by using the binary OWA model (because the binary OWA model is more efficient, but at the same time more restricting)
- As K gets bigger and bigger, the produced boolean formulas are becoming larger and larger very rapidly

Example: General OWA-Winner Instance

The optimization run below lasted for about 10 minutes. p cnf 26199 124996

Produced boolean formula is available at: owa3.dimacs

```
n=6, m=12, K=5
alpha=3 3 3 2 1

u=

Example: Binary (Approval) OWA-Winner Instance

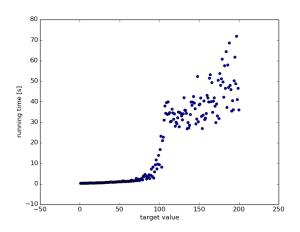

To solve this one below to optimality it took roughly 90 minutes on my machine... (there are $\binom{20}{10} = 184756$ possible comitees to check when using pure brute-force)

Running Time vs Solution Quality (target value)

kBestOWAApprovalWinner(50,12,6, μ ,4,0.3, ν); Unsatisfiability for target value=108

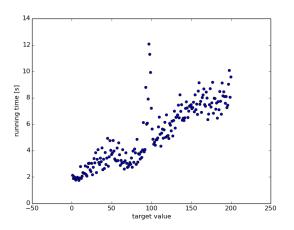

Running Time vs Solution Quality (target value) 2

kBestOWAApprovalWinner(100,24,10, μ ,1,0.3, ν); Unsatisfiability for target value=101

Clauses to Variables Ratio

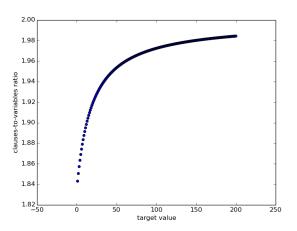

- clauses-to-variables-ratio $cv = \frac{\#clauses}{\#variables}$
- Example: $F \equiv (x_1 \lor x_2) \land (x_1 \lor \overline{x_2}) \land (\overline{x_1} \lor x_2) \land (\overline{x_1} \lor \overline{x_2})$. cv = 2
- Randomly generated SAT-CNF formulas with cv > 4.26 are mostly UNSAT, but formulas with cv < 4.26 are mostly SAT
- Studying cv for various formulas generated for both the OWA-Winner and Integer Factorization instances

Clauses to Variables for OWA-Winner Instances

kBestOWAApprovalWinner(50, 12, 6, μ , 4, 0.3, ν)

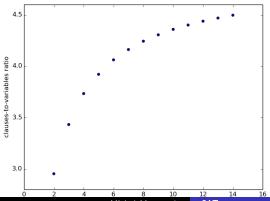

Clauses to Variables for Integer Factorization Instances

All *n*-bit integers Factorization problems corresponds to the formulas with the same cv ratio \rightarrow we consider how cv varies depending on number of bits. We show it tends to $\frac{39}{8}$.

Summary

- Reduction from the OWA-Winner to SAT-CNF was presented with some (but not all) quirks
- In addition to the general OWA-Winner, we prepared a more efficient reduction for the OWA-Winner with binary utility and OWA-vector (+ nonincreasing OWA vector)
- Running Time and Clauses to Variables Ratio were considered as measures of hardness for selected SAT-CNF instances

Thank you

Thank you!

Boolean Cardinality Constraints

- Given a set of boolean variables $\{x_1, x_2, ..., x_n\}$ we want to ensure that exactly (at least, at most,...) $k \le n$ of them are set to True
- At least one of the variables is set to True?
- Easy: $x_1 \lor x_2 \lor ... \lor x_n$
- At most one of the variables is set to True?
- Idea: Ensure that for every pair of variables at least one of the variables is False!
- How to model generic 'at least k of' and 'at most k' of constraints?

Encoding at most k of Constraint

Below is the encoding that requires additional k * n variables: s to ensure that at most k of n variables from x sequence are chosen:

$$\begin{pmatrix} (\neg x_1 \vee s_{1,1}) & & \\ (\neg s_{1,j}) & \text{for } 1 < j \leq k \\ (\neg x_i \vee s_{i,1}) & & \\ (\neg s_{i-1,1} \vee s_{i,1}) & & \\ (\neg s_{i-1,1} \vee s_{i,1}) & & \\ (\neg s_{i-1,j} \vee s_{i,j}) & & \\ (\neg x_i \vee \neg s_{i-1,k}) & & \\ (\neg x_n \vee \neg s_{n-1,k}) & & \\ \end{pmatrix} \quad \text{for } 1 < j \leq k$$

[1] Source: Towards an Optimal CNF Encoding of Boolean Cardinality Constraints

Implementation of at most k of Constraint

Below is my implementation of at most k of encoding proposed by

```
Sinz:
  def at most k of(self, x, k):
      n = len(x)
      if n <= 1:
      s = [[self.add var() for i in xrange(k)] for i in xrange(n-1)]
      self.add clause([\sim x[0], s[0][0]])
       for j in xrange(1, k):
           self.add clause([~s[0][i]])
       for i in xrange(1, n-1):
           self.add clause([~x[i], s[i][0]])
           self.add clause([~s[i-1][0], s[i][0]])
           for j in xrange(1, k):
               self.add\ clause([\sim x[i], \sim s[i-1][j-1], s[i][j]])
               self.add clause([~s[i-1][j], s[i][j]])
           self.add clause([\sim x[i], \sim s[i-1][k-1]])
      self.add clause([\sim x[n-1], \sim s[n-2][k-1]])
       return s
```
